

Abstract of Disclosure

5

The disposable aid is formed as a folded drain member (21) with walls of a hygiene paper which is formed by folding along a central line. The drain member (21) contains an inlet section (22) for the reception of urine, a
10 drain section (23) for the draining of urine into a toilet or the like and a sideways projecting holding part (24) which is connected to the inlet section (22). The inlet section (22) is formed of two wall sections of the same design (26; 27) and can be formed through it into a funnel. A plurality of drain members (21) can be manufactured individually or in roll form and
15 packed into a dispenser. The drain members can be made at favourable cost and enable a comfortable, hygienically advantageous use as well as a simple disposal.
